Contents

List of Contributors	XV
Foreword	
Series Preface	xix
Preface for Volume 16: Food Control and Biosecurity	
Chapter 1: Introduction in Food Safety, Biosecurity and Hazard Control	1
Coralia Bleotu, Mariana Carmen Chifiriuc, Razvan Socolov, Demetra Socolov	
1 Introduction	1
2 Ensuring Food Safety Along the Food Chain	
2.1 Raw Material	2
2.2 Food Preservation	6
2.3 Food Processing	8
2.4 Food Additives	14
3 Conclusions	
References	
Chapter 2: Potential Hazards and Biosecurity Aspects Associated on Food Safety	25
Ema Maldonado-Simán, Citlalli C. González-Ariceaga,	
Raymundo Rodríguez-de Lara, Marianella Fallas-López	
1 Introduction	
2 Potential Hazards	
2.1 Zoonosis	26
2.2 Microbial Pathogens	30
2.3 Genetically Modified Organisms	
2.4 Nonmicrobial Hazards	
3 Biosecurity	
4 Future Challenges and Economic Factors	
5 Conclusions	
References	

Chapter 3: Tools in Improving Quality Assurance and Food Control	63
Ilija Djekic, Igor Tomasevic	
1 Quality as a Phenomenon	
2 Seven Basic Quality Tools	
2.1 Flowcharts in the Food Industry	
2.2 Check Sheets in the Food Industry	
2.3 Histograms in the Food Industry	
2.4 Pareto Diagrams in Food Industry	
2.5 Cause and Effect Diagrams in Food Industry	
2.6 Scatter Diagrams in Food Industry	81
2.7 Control Charts in the Food Industry	
3 Conclusions	
References	
Chapter 4: Chemometrics Applied to Food Control	
Evandro Bona, Paulo H. Março, Patrícia Valderrama	
1 Introduction	
2 Data Preparation	
3 Linear Methods	
3.1 Exploratory Analysis	
3.2 Classification	
3.3 Regression	
4 Nonlinear Methods	
4.1 Exploratory Analysis	114
4.2 Classification and Regression	
5 Model Validation	
6 Conclusions	
References	
Chapter 5: Food Defense	
Frank Moerman, Sr.	
1 Introduction	
2 Intentional Food Contamination	
2.1 The Agriculture and Food Sector as Targets of Intentional	
Food Contamination	
2.2 Intentional Contamination in the Agrifood Chain	
3 Agents Used in Intentional Food Contamination	
3.1 Agents Used in Malicious Assaults on Agricultural Commodities	
(e.g., Agroterrorism)	
3.2 Agents Used in Malicious Assaults on Food (e.g., Food Terrorism)	
3.3 Agents Used by Disgruntled Individuals and Economically	
Motivated Perpetrators	
4 Challenges in the Detection and Response to Intentional Acts	
of Contamination in the Agrifood Chain	

5	Objectives and Outlook	. 144
	5.1 Objectives of Malicious Assaults on Agricultural Commodities and Food	
	5.2 Outlook	
6	Food Security, Food Quality, Food Safety, Food Defense,	
	and Food Protection	149
	6.1 Food Security	
	6.2 Food Quality	
	6.3 Food Safety	
	6.4 Food Defense	
	6.5 Food Protection	
7	Categories of Perpetrators	
	7.1 Malicious Contamination of Food by Nations	
	7.2 Malicious Contamination of Food by Nonstate Actors	
	7.3 Intentional Contamination for Economic and/or Financial Gain	
8	Legal Requirements	
	Developing, Implementation, Validation, and Maintaining	
	a Food Defense Plan	160
	9.1 "Food Defense" versus "Food Safety Management Systems"	
	9.2 Developing a Food Defense Plan	
	9.3 Implementation of the Food Defense Plan	
	9.4 Validation/Verification of the Food Defense Plan	
	and Corrective Actions	165
	9.5 Maintaining the Effectiveness of the Food Defense Plan	
10	Tools Applied in the Development of a System of Food Defense	
	10.1 Vulnerability Assessment Tools	
	10.2 Mitigation Strategies	
	10.3 Tools Useful to Train Employees in Food Defense	
11	Accessibility to Attractive Targets	
	11.1 Agriculture Production and Harvesting as a Target, and Food Defense	
	11.2 Most Attractive Targets for Intentional Contamination of Food	
	11.3 Accessibility	
	11.4 Traditional and Emerging Techniques of Access Control	
12	Food Defense in Practice	
	12.1 Food Defense Measures to Prevent Ingress at the Perimeter	
	of the Plant Site	185
	12.2 Food Defense Measures to Prevent Ingress at Building Envelope	189
	12.3 Food Defense Measures for Inside the Building	
	12.4 Food Defense Strategies in the Employment of the Factory Staff	
	12.5 Food Defense Strategies Applicable to Personnel Employed	
	by Contractors	196
	12.6 Food Defense Strategies Applicable to Outsiders	
	12.7 Security of Utilities and Process Aids	
	12.8 Storage Security	
	12.9 Logistics Security	201

of Raw Materials, Ingredients, Packaging Materials	203
12.11 Food Defense Strategies in the Purchase and Receipt of Livestock	
12.12 Food Defense Strategies for Shipping of Finished Products	
12.13 Security of Fuels and Other Technical Chemicals	
12.14 Laboratory Security	209
12.15 Data/Cyber Security	209
12.16 Inspection Procedures and Compliance Documentation	209
12.17 Waste Security	210
12.18 Procedures to Tackle Food Fraud by Criminal Competitors	210
13 Emergency Procedures	210
13.1 Emergency Response	210
13.2 Recall, Containment, Decontamination, and Disposal of Products	
13.3 Recovery	
14 Cost of Food Defense	
15 Involvement of Authorities in Food Defense	
15.1 Role of the Government in Food Defense	216
15.2 Internationally Recognized Schemes to Tackle and Manage	
Acts of Intentional Food Contamination	
16 Conclusions

Foreword

In the last 50 years an increasing number of modified and alternative foods have been developed using various tools of science, engineering, and biotechnology. The result is that today most of the available commercial food is somehow modified and improved, and made to look better, taste different, and be commercially attractive. These food products have entered in the domestic first and then the international markets, currently representing a great industry in most countries. Sometimes these products are considered as life-supporting alternatives, neither good nor bad, and sometimes they are just seen as luxury foods. In the context of a permanently growing population, changing climate, and strong anthropological influence, food resources became limited in large parts of the Earth. Obtaining a better and more resistant crop quickly and with improved nutritional value would represent the Holy Grail for the food industry. However, such a crop could pose negative effects on the environment and consumer health, as most of the current approaches involve the use of powerful and broad-spectrum pesticides, genetic engineered plants and animals, or bioelements with unknown and difficult-to-predict effects. Numerous questions have emerged with the introduction of engineered foods, many of them pertaining to their safe use for human consumption and ecosystems, long-term expectations, benefits, challenges associated with their use, and most important, their economic impact.

The progress made in the food industry by the development of applicative engineering and biotechnologies is impressive and many of the advances are oriented to solve the world food crisis in a constantly increasing population: from genetic engineering to improved preservatives and advanced materials for innovative food quality control and packaging. In the present era, innovative technologies and state-of-the-art research progress has allowed the development of a new and rapidly changing food industry, able to bottom-up all known and accepted facts in the traditional food management. The huge amount of available information, many times is difficult to validate, and the variety of approaches, which could seem overwhelming and lead to misunderstandings, is yet a valuable resource of manipulation for the population as a whole.

The series entitled *Handbook of Food Bioengineering* brings together a comprehensive collection of volumes to reveal the most current progress and perspectives in the field of food engineering. The editors have selected the most interesting and intriguing topics, and have dissected them in 20 thematic volumes, allowing readers to find the description of

Foreword

basic processes and also the up-to-date innovations in the field. Although the series is mainly dedicated to the engineering, research, and biotechnological sectors, a wide audience could benefit from this impressive and updated information on the food industry. This is because of the overall style of the book, outstanding authors of the chapters, numerous illustrations, images, and well-structured chapters, which are easy to understand. Nonetheless, the most novel approaches and technologies could be of a great relevance for researchers and engineers working in the field of bioengineering.

Current approaches, regulations, safety issues, and the perspective of innovative applications are highlighted and thoroughly dissected in this series. This work comes as a useful tool to understand where we are and where we are heading to in the food industry, while being amazed by the great variety of approaches and innovations, which constantly changes the idea of the "food of the future."

Anton Ficai, PhD (Eng)

Department Science and Engineering of Oxide Materials and Nanomaterials, Faculty of Applied Chemistry and Materials Science, Politehnica University of Bucharest, Bucharest, Romania

Series Preface

The food sector represents one of the most important industries in terms of extent, investment, and diversity. In a permanently changing society, dietary needs and preferences are widely variable. Along with offering a great technological support for innovative and appreciated products, the current food industry should also cover the basic needs of an ever-increasing population. In this context, engineering, research, and technology have been combined to offer sustainable solutions in the food industry for a healthy and satisfied population.

Massive progress is constantly being made in this dynamic field, but most of the recent information remains poorly revealed to the large population. This series emerged out of our need, and that of many others, to bring together the most relevant and innovative available approaches in the intriguing field of food bioengineering. In this work we present relevant aspects in a pertinent and easy-to-understand sequence, beginning with the basic aspects of food production and concluding with the most novel technologies and approaches for processing, preservation, and packaging. Hot topics, such as genetically modified foods, food additives, and foodborne diseases, are thoroughly dissected in dedicated volumes, which reveal the newest trends, current products, and applicable regulations.

While health and well-being are key drivers of the food industry, market forces strive for innovation throughout the complete food chain, including raw material/ingredient sourcing, food processing, quality control of finished products, and packaging. Scientists and industry stakeholders have already identified potential uses of new and highly investigated concepts, such as nanotechnology, in virtually every segment of the food industry, from agriculture (i.e., pesticide production and processing, fertilizer or vaccine delivery, animal and plant pathogen detection, and targeted genetic engineering) to food production and processing (i.e., encapsulation of flavor or odor enhancers, food textural or quality improvement, and new gelation- or viscosity-enhancing agents), food packaging (i.e., pathogen, physicochemical, and mechanical agents sensors; anticounterfeiting devices; UV protection; and the design of stronger, more impermeable polymer films), and nutrient supplements (i.e., nutraceuticals, higher stability and bioavailability of food bioactives, etc.).
